## Houses of the Future

### Аннотация

In this article, I will talk about how I see the construction of houses of the future. How will they be built? What will they be like? In addition, whether they will be available to ordinary people at all.

I believe that houses in the future will be built mainly in rural areas.

- This is because lately people want to leave the city, somewhere in the suburbs, in the village, in the village. Get away from the hustle and bustle of the city, the race for money. To retire with yourself, with your family, to build a warm, wonderful relationship with them.
- Also outside the city, there is fresh air, picturesque nature, green forest, clean river and rich wildlife. For a person, this environment is not only comfortable, but also healthy.

The house of the future will definitely be energy efficient. Only high quality and environmentally friendly construction solutions used for the construction. The quality of the building will be at the highest level, better than in European countries. Our buildings of the future will be famous in all over the world.

In the future, most people will work remotely. A decent income will allow you to build a house using any finishing materials, which will not affect the quality of the building.

The house will have all the amenities. Starting from modern alarm systems and ending with ultra-high-speed Internet. The smart home system will become a common attribute of the home of the future.

Professionals in their field will develop the interior and design. All those who will work on the construction of houses will be qualified and competent in this field. To make an eco-friendly, high quality, warm and comfortable home.

I hope that in the future there will be affordable building materials in Russia, various benefits and subsidies for construction. This will not only increase the quantity and quality of buildings, but will also improve the demography of Russia.

For sure, automated construction is the future construction. Thanks to new technologies, new machines will be produced that will significantly reduce the construction time. People will create their own landscape of their site thanks to new technologies.

That is my subjective opinion. I think it's quite real.
